HOMELAB · OCTOBER 2026

Homelab Command Center

One dashboard for a Proxmox and Unraid homelab: live host and disk telemetry, service health, a local AI assistant with auditable evidence, and guarded one-click updates.

React 18 · Python backend · Proxmox VE · Unraid · Intel Arc A310 · llama.cpp

28
services monitored

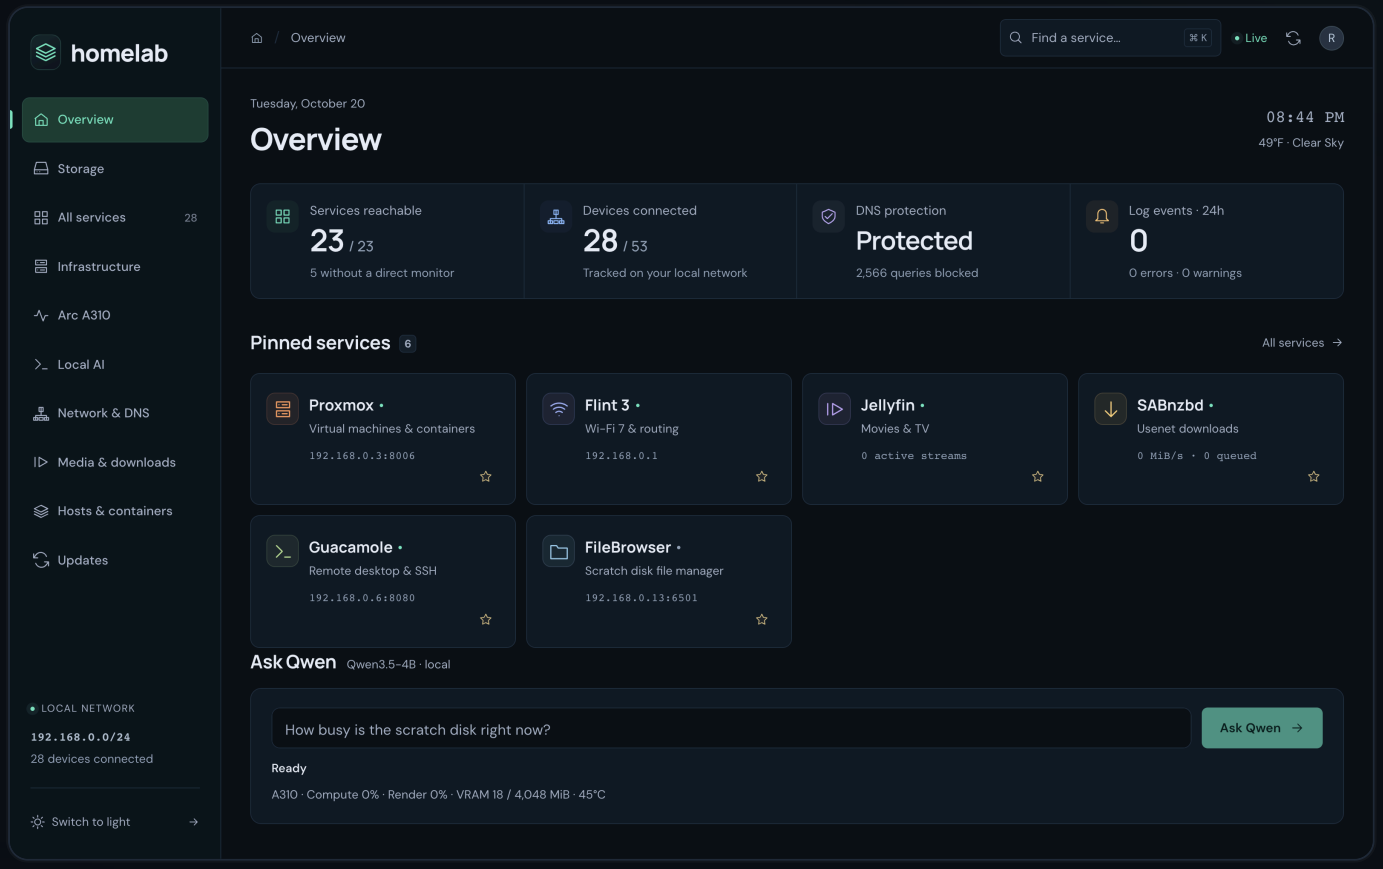

13
VMs & containers

24 h
rolling disk history

01 · OVERVIEW

Everything that matters, at a glance

Status tiles answer “is anything wrong?” in three seconds. Pinned services sit right below, with the local Qwen assistant one tap away.

Honest status

Every source carries a freshness timestamp. Missing readings show as “—”, never a fake zero.

Action guard

DNS pause, log clear and updates require a same-origin custom header, so other websites can’t trigger them.

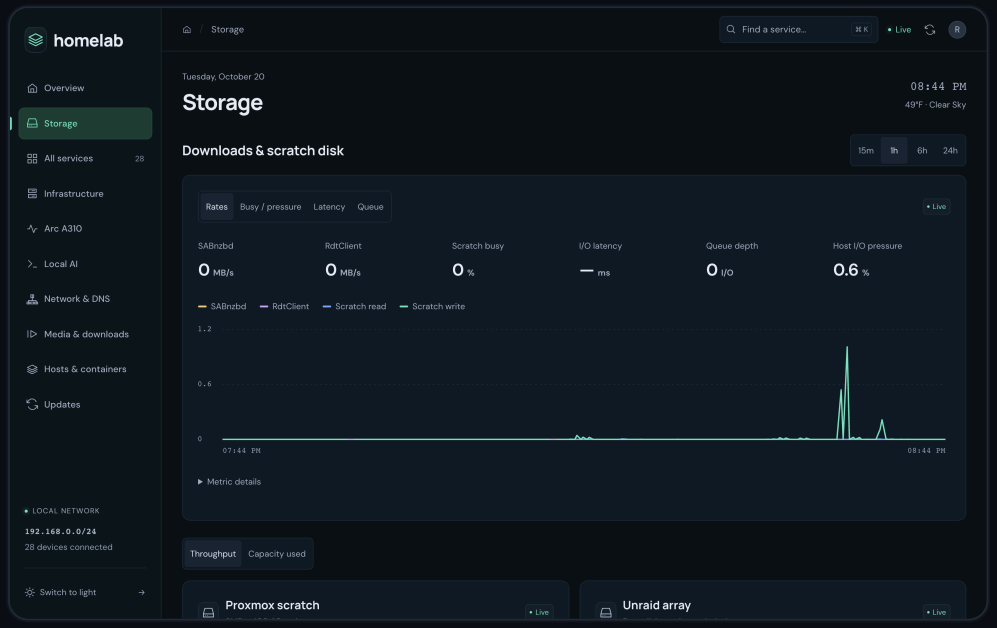

Phone-first

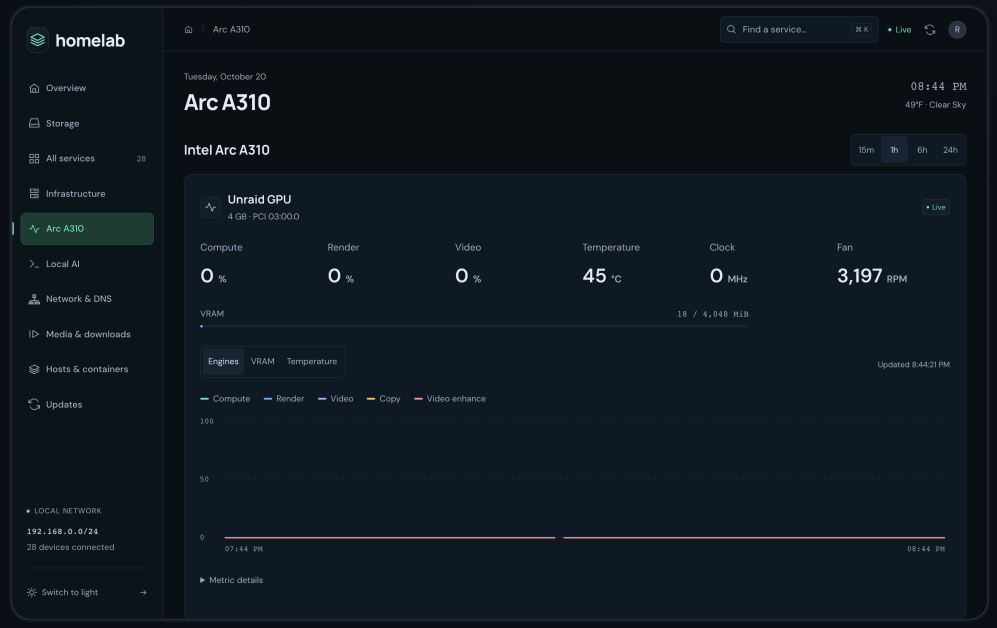

44 px touch targets and no overflow from 360 px phones to 3440 px ultrawides.

02 · STORAGE & GPU

Disk activity and the Arc A310, measured not guessed

Physical disk throughput, busy time, latency and queue depth from cumulative kernel counters, plus live render, compute and VRAM on the Arc GPU.

Cache fill forecast

Projects when the Unraid cache fills and starts the mover before it does.

Self-healing mounts

A watchdog remounts stale network shares within about two minutes.

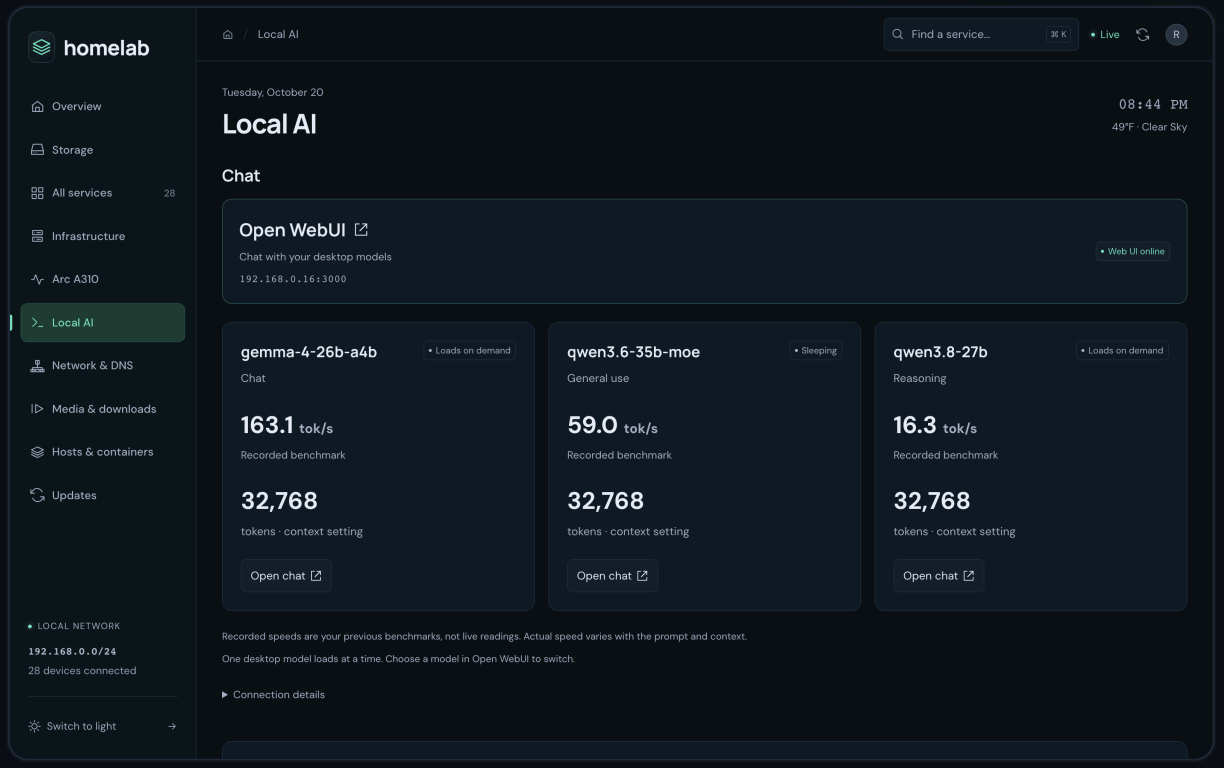

Gaps stay gaps

Reboots and counter resets break the chart instead of inventing data.

03 · LOCAL AI

Private models, with receipts

Desktop models on an RTX 5070 Ti through llama.cpp, plus an on-demand Qwen on the Arc A310 that answers from live homelab data and shows exactly what it was given.

Measured speeds

Gemma 4 26B 163 tok/s

Qwen 3.6 35B MoE 59 tok/s · 32K

Qwen 3.8 27B 16 tok/s

Evidence view

Every answer lists the exact observations, capture time and omitted sources.

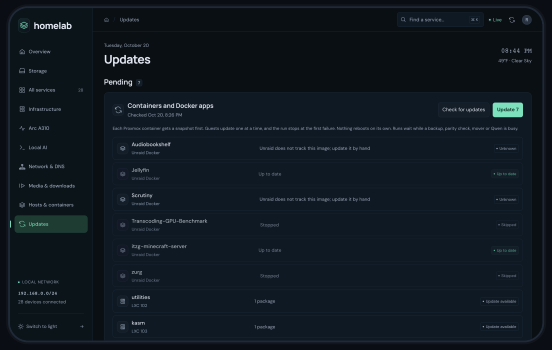

Read-only tools

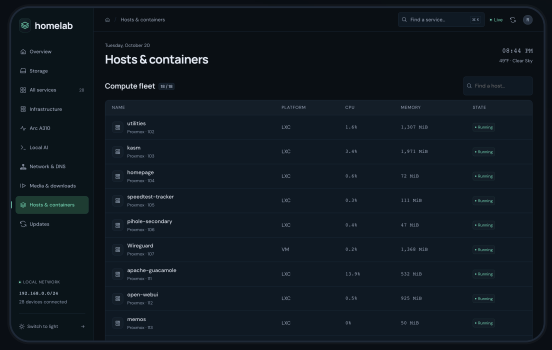

Open WebUI models check hosts through a fixed-command SSH broker. No arbitrary shell.

04 · OPERATIONS

Guarded updates and the whole fleet

Snapshot first, one guest at a time, stop at the first failure. The fleet view lists every VM, LXC and Docker app with live CPU and memory.

Snapshot-first updates

Each LXC is snapshotted before apt upgrade; Docker apps update through Unraid's own updater. Runs wait while backups, parity checks or the local model are busy.

Locked-down access

The dashboard reaches Proxmox through one SSH key that only accepts status, health, check and start.
