HOMELAB · OCTOBER 2026

# Homelab Command Center

A dashboard for my Proxmox and Unraid homelab. The first screen says whether anything needs attention. The other pages cover services, disks, network, backups, updates and the local AI models.

React 18 · Python backend · Material 3 Expressive · Proxmox VE · Unraid · Intel Arc A310 · llama.cpp

**28** services monitored

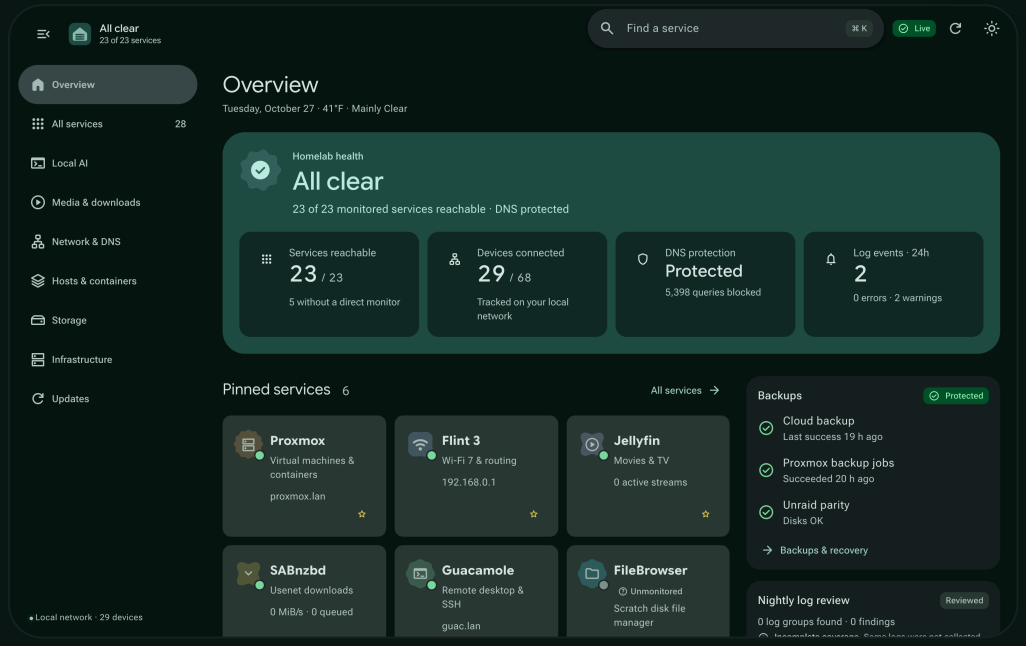

**20** VMs, containers & apps

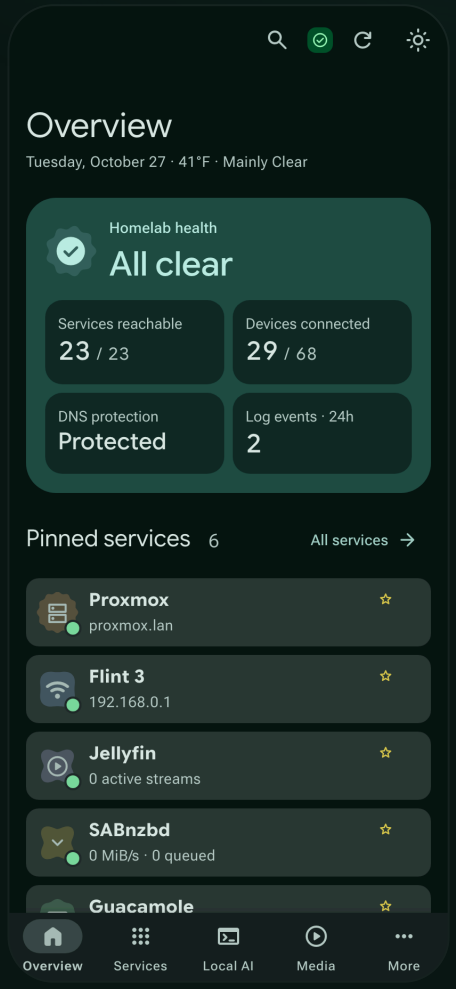

**10** automated UI check suites

01 · OVERVIEW

# Overview

The top card says "All clear" or lists what needs attention, and each item links to its page. Pinned services come next, then the quick actions: wake or sleep the gaming PC, pause DNS blocking for five minutes, and check for updates.

### On a phone

The health card and four pinned services fit on the first screen.

### Confirmations

Actions that change something ask first, and the server only accepts them from the dashboard.

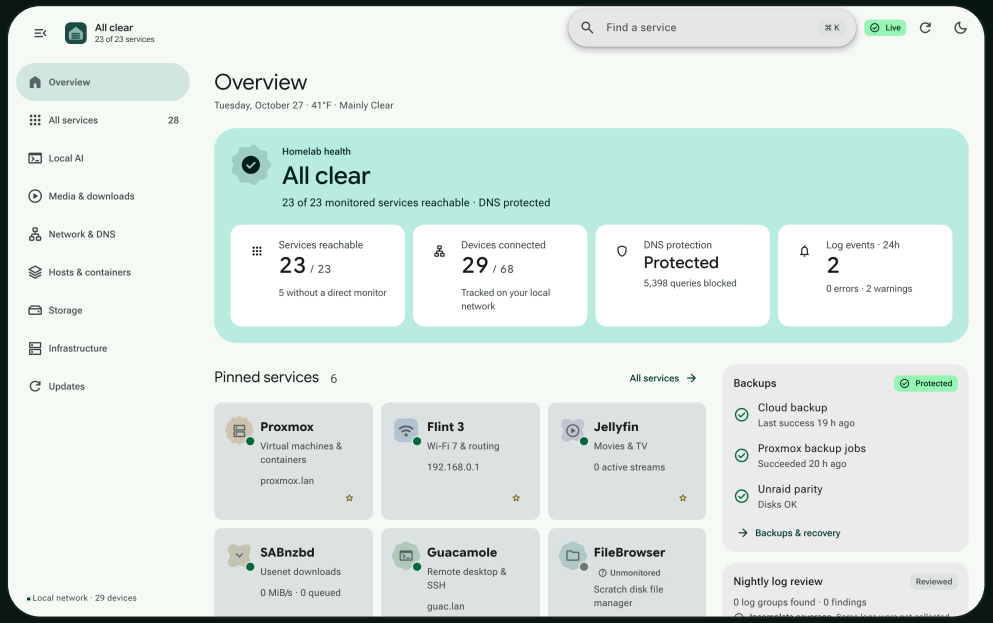

### Missing readings

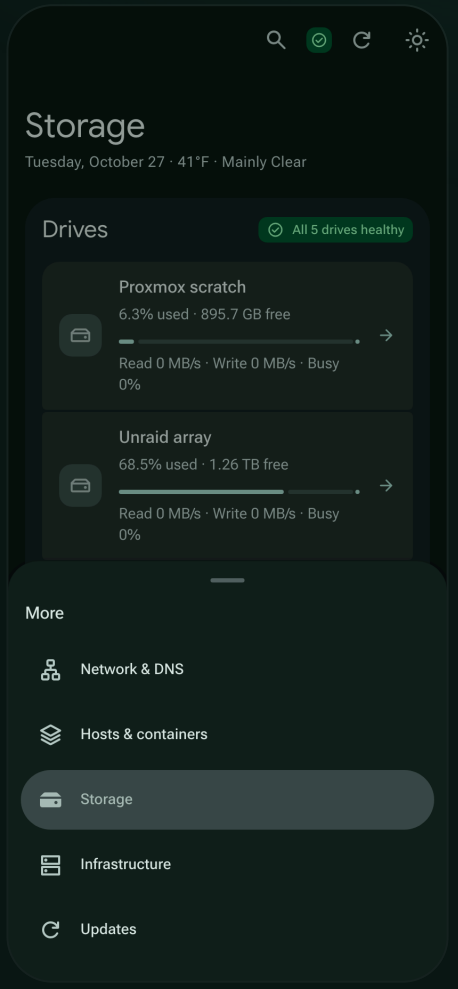

Each reading has a timestamp. If a source stops answering, its tile shows a dash instead of zero.

02 · DESIGN

# Material 3 Expressive design

The colours come from Google's Material colour library, generated from a single dark green for both the light and dark themes. Layout, shapes and motion follow Material 3 Expressive, Google's 2025 update to Material Design.

### Shapes

The health icon sits in a scalloped shape that changes when something is wrong. Each service category has its own icon shape, and the loading indicator morphs between shapes.

### Motion

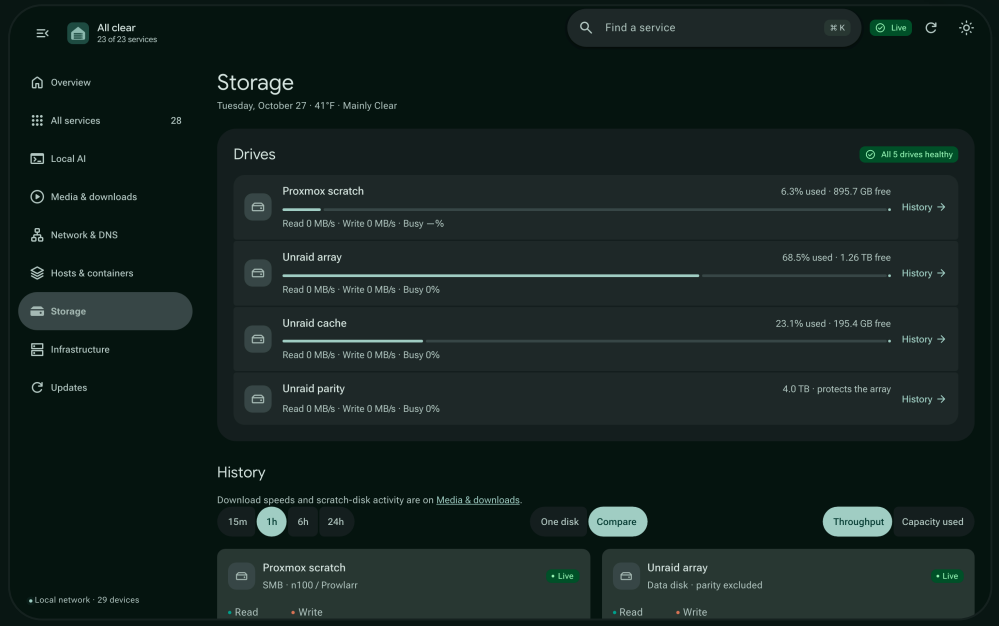

Pages slide into place, a tapped row turns into the next page's title, and buttons change shape when pressed. The system's Reduce motion setting turns all of it off.

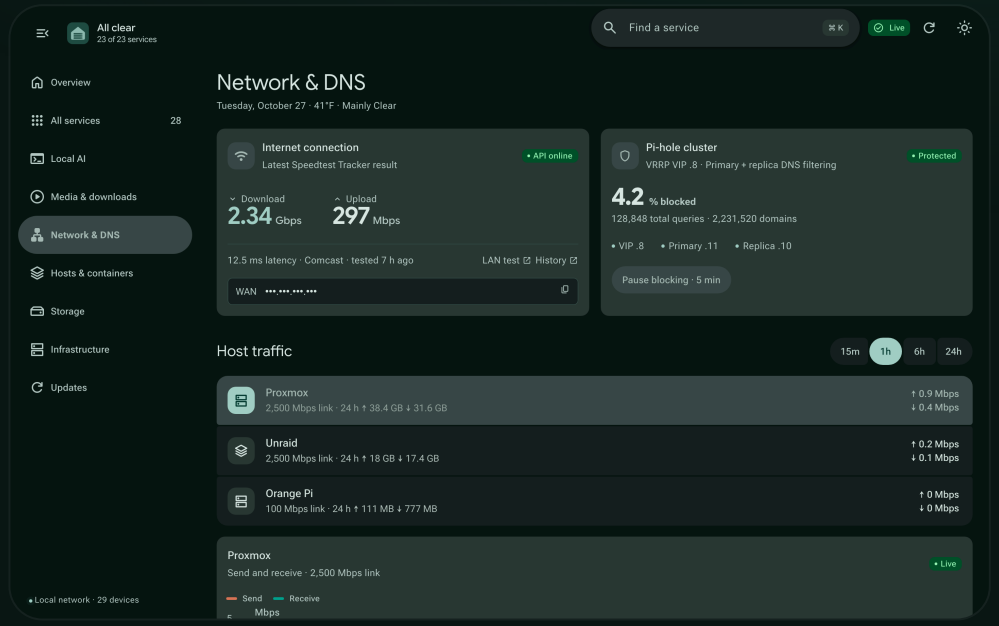

### Accessibility

Text contrast is at least 4.5:1 in both themes. Automated tests cover keyboard focus, dialogs and navigation.

# Storage and network

Storage opens with each drive's free space, live read and write rates and SMART health. Network opens with the latest speed test and the two Pi-hole servers. History charts come after that, one disk or host at a time on a phone or side by side on a wider screen.

### Cache forecast

Estimates when the Unraid cache will fill and starts the mover before it does.

### Chart colours

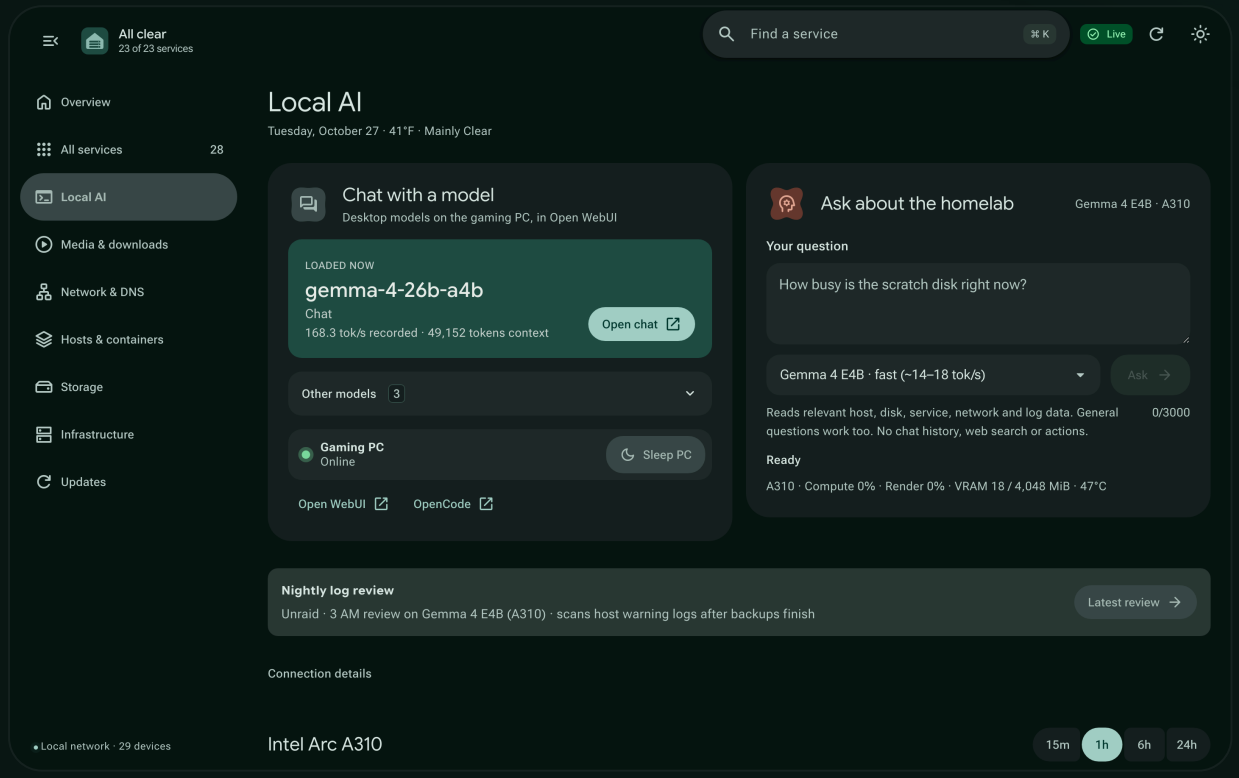

Each line colour was checked for colour-blind readers in both themes.

### Gaps

If a host reboots, its chart shows a gap for the missing time.

# Local AI

Four models run on the gaming PC's RTX 5070 Ti through llama.cpp. The page puts the loaded model first with an Open chat button, next to the Wake and Sleep controls. A smaller Gemma model on the Arc A310 answers questions about the homelab and lists the readings it used.

### Recorded speeds

Gemma 4 26B · 168 tok/s
Qwen 3.6 35B MoE · 82 tok/s
Qwen 3.8 27B · 55 tok/s
Qwen 3.8 27B uncensored · 51 tok/s
Gemma 4 E4B on the A310 · 14 to 18 tok/s

### Sources

Each answer lists the readings the model was given and when they were taken.

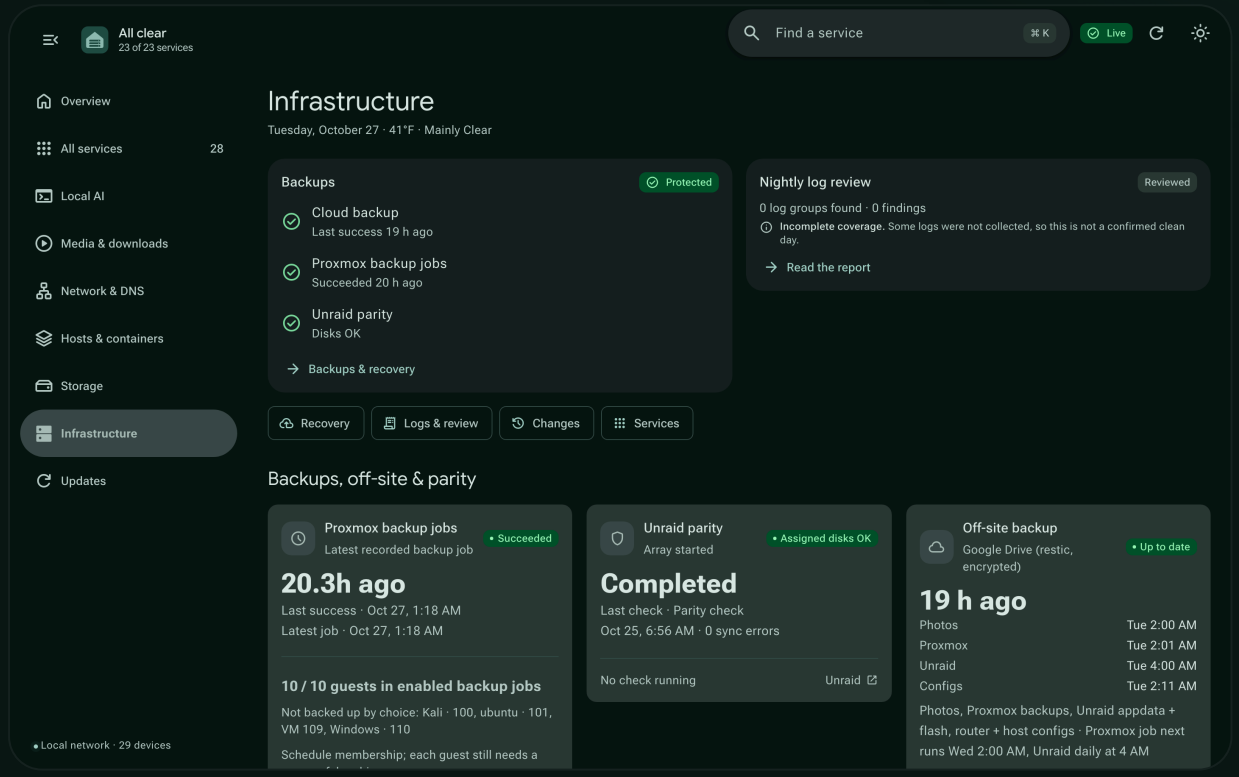

### Read-only tools

Models in Open WebUI can query the servers through a fixed set of commands and nothing else.

05 · RECOVERY

# Backups and recovery

Local Proxmox backups, the off-site copy in Google Drive and Unraid parity are shown together, with restore test results below them. Each night after the backups finish, the A310 model reviews the host warning logs.

### Off-site copy

restic encrypts photos, Proxmox backups, Unraid app data and router and host configs before uploading them to Google Drive. It keeps 7 daily, 4 weekly and 12 monthly snapshots.

### Restore tests

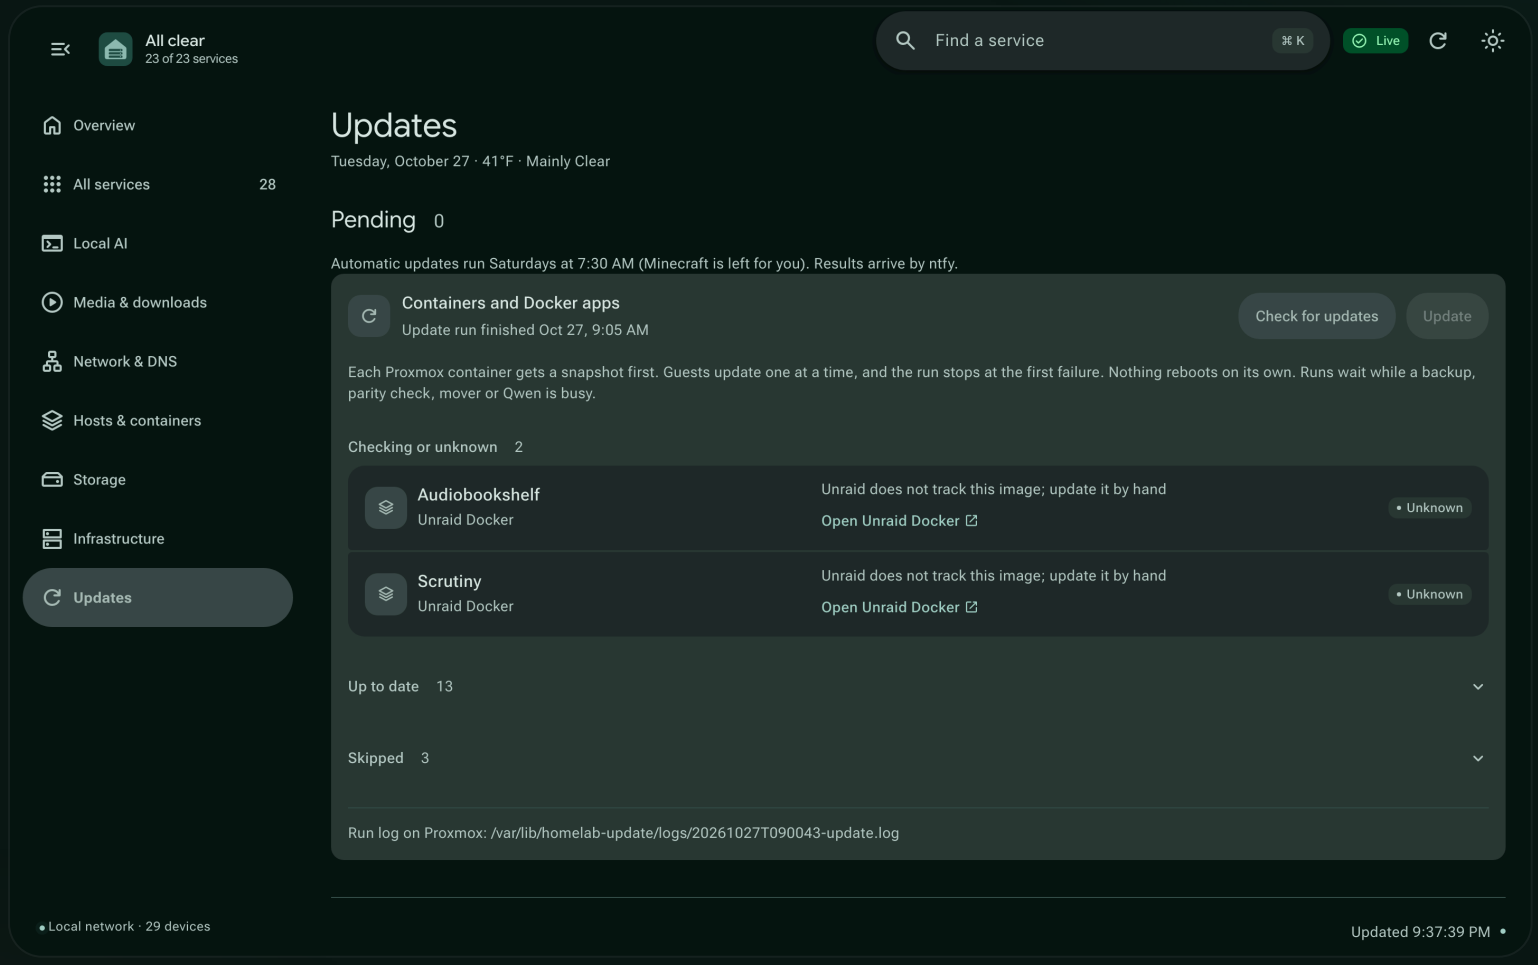

A scheduled test downloads sample files from Google Drive and compares them with the originals.

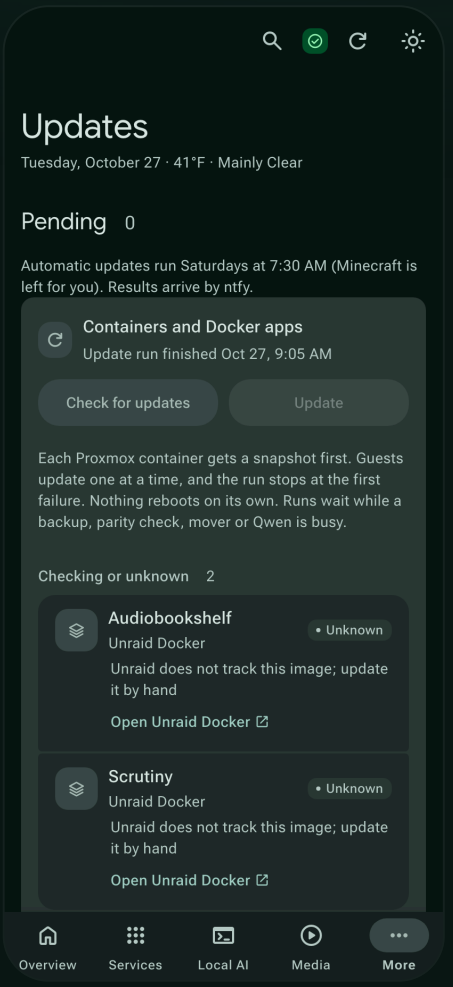

### Section links

Buttons at the top of the page jump to recovery, logs, the change history or the service list.

# Updates

Each Proxmox container is snapshotted before `apt upgrade` runs, and Docker apps update through Unraid's own updater. Guests update one at a time; a failure stops the run and shows the rollback command. Items with an update waiting are listed first, and current or skipped ones are folded away.

# Hosts, containers and services

Proxmox, Unraid and the Orange Pi are at the top, followed by CPU, memory and state for every VM, container and Docker app. The services page groups everything by category, and unreachable, stale and unmonitored services are labelled in text as well as colour.
